# Real SpliceBERT attention corroborates the discovered circuit

SpliceBERT.1024nt, live CPU forward pass on a canonical short-intron donor–acceptor example (intron 106 nt, within the 60–150 nt licensed regime). Left: the address read (donor query → paired-acceptor key) for all 6×16 heads; the eight licensed circuit heads are ringed. L3H1's read is 7.5× the all-head mean and L0H7 (top payload head, N=0.348) is the strongest address head — the mechanism appears unprompted in the raw weights. Right: full attention maps of three circuit heads. Attention magnitude is observational; head necessity is established by intervention (Fig. 1c) — the brightest non-circuit head (L5H2) attends strongly yet is not causally required.
